

SF1.4: Population by age of children and young adults, and youth dependency ratio

Definitions and methodology

This indicator presents information on child and young adult populations through three main measures:

- The *estimated population aged 0-24*, also further disaggregated into the estimated population aged 0-14, and the estimated population aged 15-24.
- The *distribution of children and young adults aged 0-24*, by five-year age groups
- The *youth dependency ratio*, defined as the number of children and young people (aged 0-20) per one hundred people of working age (aged 20-64), and calculated as: (number of people aged less than 20) / (number of people aged 20-64) * 100. The youth dependency ratio is used here to capture the number of young persons that are likely to be "dependent" on the support of others for their daily living to the number of those who are capable of providing such support. It is presented both for 1950-2020 and future years (2025-2050), with the data for future years based on the UN Population Division's 'medium fertility variant' population projections.

Data in all cases are taken from the United Nations Population Division World Population Prospects database (2019 revision).

Key findings

Child and young adult populations vary considerably across Asia/Pacific countries, reflecting in large part variations in overall population sizes but also differences in trends and levels of fertility (see Indicator SF2.1). Among the ten Asia/Pacific countries covered here, Singapore and New Zealand have the fewest children and young adults, at roughly 1.5 million. Unsurprisingly, China has the largest child and young adult population, at almost 425 million.

In many Asia/Pacific countries, as also in many OECD countries, younger child cohorts tend to be slightly smaller than older cohorts. Chart SF1.4.B shows the distribution of the child and young adult population by five-year age group for each Asia/Pacific country, plus also the average for OECD countries. For most covered Asia/Pacific countries, the largest five-year age group is the 20-24 year-old age group. However, in Australia, Indonesia and Viet Nam, younger cohorts (0-4 year-old and 5-9 year-old) are actually slightly larger than older cohorts.

Persistently low fertility (see Indicator SF2.1) means that the child (0-14 year-old) population has been falling in recent years in most of the covered Asia/Pacific countries (Chart SF1.4.C). In China, Japan and Thailand, the current 0-14 year-old population is about 20% smaller than it was in the year 2000, while in Korea the decline is as large as almost 35%. This is an exaggerated version of a trend also seen in many OECD countries, with the OECD total child population declining by about 2.8% since 2000. However, in Australia, Indonesia and New Zealand the child population has actually increased slightly in recent years. In Australia, the current child population is almost 25% larger than it was in 2000.

Youth dependency ratios have also been falling in Asia/Pacific countries in recent years (Chart SF1.4.D). Indonesia has the highest current youth dependency ratio among the covered Asia/Pacific countries (58 children and young people per one hundred people of

working age), and Singapore the lowest (24 children and young people per one hundred people of working age), but in all covered countries the ratio in 2020 is well below that in 1990. Declines since 1990 are largest in Thailand (40 points), Malaysia (44 points) and Viet Nam (56 points). In most Asia/Pacific countries, youth dependency ratios are expected to stabilise over the next few decades, and in some (Japan and Korea) could perhaps even increase slightly from 2040 (Chart SF1.4.E).

Comparability and data issues

All data presented in this indicator are taken from the United Nations Population Division World Population Prospects database (2015 revision). To ensure comparability, the United Nations Population Division employs (as far as is possible) a single, consistent, and internationally accepted method for its estimates for all countries. Detailed information on the methods and assumptions used by the United Nations Population Division when producing both its estimates of past populations and its projections of future populations can be found on the United Nations Population Division World Population Prospects webpage (<https://esa.un.org/unpd/wpp/>) and in [United Nations \(2019\) World Population Prospects: The 2019 Revision, Methodology of the United Nations Population Estimates and Projections](#).
